Cross-Cutting UI	0/2

What to test, and how

This covers every ability across all three portals — Admin, Custodian, and Maintenance Personnel — organized by module in the same order they appear in the sidebar.

Each card has a **Scenario** (a realistic situation to set up) and a **Workflow** (the exact steps to run through it). Check a card off as you confirm it works; progress is saved in this browser.

Use the role chips or the search box on the left to narrow the list while you're focused on one portal.

Authentication & Account 0/4 tested

Log In

☐ Tested

Admin

Custodian

Maintenance

Token-based sign-in. The account's role (or roles) determines which sidebar modules and dashboard appear after login.

SCENARIO

A tester needs to confirm all three portals look and behave correctly on first login.

WORKFLOW

1. Go to /login and sign in as an Admin account.
2. Confirm the sidebar shows the full Admin module list and the Admin dashboard loads.
3. Log out, repeat as a Custodian account, then as a Maintenance Personnel account.
4. Confirm each portal only shows its own module set.

Remember Me

☐ Tested

Admin

Custodian

Maintenance

Toggles whether the session token is kept in `localStorage` (survives closing the browser) or `sessionStorage` (cleared once the tab closes).

SCENARIO

A user logs in on a shared computer and wants to be sure they aren't left signed in.

WORKFLOW

1. Log in with Remember Me left

UNCHECKED

2. Close the browser tab entirely and reopen the app — confirm it's back at the login screen.

3. Log in again with Remember Me

CHECKED

, close and reopen the tab — confirm it's still signed in.

Log Out

☐ Tested

Admin

Custodian

Maintenance

Clears the session from both storages and returns to the login page.

SCENARIO

End of a work session.

WORKFLOW

1. Open the account menu and click Logout.
2. Confirm you land on /login.
3. Try navigating back to a protected page directly — confirm it redirects to login instead of showing data.

Change Password

☐ Tested

Admin

Custodian

Maintenance

Update your own password after verifying the current one, from the profile/account menu.

SCENARIO

A user wants to replace a temporary or weak password.

WORKFLOW

1. Open the profile/account settings panel.
2. Enter the current password plus a new one and save.
3. Log out and log back in using the new password to confirm it took effect.

Dashboard 0/6 tested

The dashboard is role-scoped — every role sees vehicle totals, but the metrics, badges, and panels below them differ by which hat you're wearing.

Role-Scoped Metric Tiles

☐ Tested

Admin Custodian Maintenance

Admin sees fleet-wide totals plus total maintenance expenses; Custodian sees their own reported-issue count; Maintenance Personnel sees records, upcoming/overdue maintenance, and vehicles needing attention.

SCENARIO

Comparing what each role actually sees at a glance.

WORKFLOW

1. Log in as Admin, note every metric tile shown.
2. Log in as Custodian, confirm "My Reported Issues" only counts that account's own reports.
3. Log in as Maintenance Personnel, confirm "Vehicles Needing Attention" and maintenance-record metrics appear.

Readiness & Coverage Panel

☐ Tested

Admin

Groups vehicles by type and shows ready vs. verified-ready vs. down counts, flagging a "no coverage" alarm when an entire type has zero ready units.

SCENARIO

The barangay's only ambulance goes into the shop.

WORKFLOW

1. Open a ticket on the only vehicle of a given type and submit an inspection with "Needs Maintenance".
2. Reload the dashboard.
3. Confirm that vehicle type's readiness panel shows 0 ready and a no-coverage flag.

Single-Point-of-Failure Fragility

☐ Tested

Admin

Flags any vehicle type currently down to one (or zero) ready units as a standing risk — before anything else even breaks.

SCENARIO

A type has two units; one is already under repair.

WORKFLOW

1. Send one of two same-type vehicles into an active ticket.
2. Reload the dashboard.
3. Confirm that type is flagged as fragile (single point of failure), and critical if the last one also goes down.

Preventive Maintenance Watch

☐ Tested

Admin

Maintenance

Surfaces overdue and due-soon scheduled maintenance as an at-risk list rather than a plain calendar entry.

SCENARIO

A preventive-maintenance date has quietly passed.

WORKFLOW

1. Create a maintenance schedule dated yesterday.
2. Reload the dashboard.
3. Confirm it appears in the overdue watch list.

Availability Forecast

☐ Tested

Admin

Lists every vehicle currently under maintenance with its estimated return date, soonest first, so "out of service" reads as a forecast instead of a blank.

SCENARIO

Someone needs to know when a specific vehicle will be back.

WORKFLOW

1. Log repairs on a work order and set an estimated return date.
2. Reload the dashboard.
3. Confirm that vehicle appears in the forecast list with the date you set.

Recent Activity Feed

☐ Tested

Admin

Custodian

Maintenance

A rolling feed of the most recent fleet-history events, for a quick "what just happened" glance.

SCENARIO

Confirming actions taken elsewhere in the app actually show up here.

WORKFLOW

1. Edit a vehicle, then run a readiness check on it.
2. Reload the dashboard.
3. Confirm both events appear in the activity feed, most recent first.

Issue Reports 0/4 tested

Report a Vehicle Issue

☐ Tested

Admin **Custodian** **Maintenance**

Flags a problem with a specific vehicle — issue type, description, severity, and an optional photo. Any role can file one, though it's most used by Custodians in the field.

SCENARIO

A custodian notices a strange engine noise during a routine check.

WORKFLOW

1. Open Issue Reports → Add.
2. Pick the vehicle, describe the issue, set severity, attach a photo.
3. Submit and confirm it appears in the list with status Pending.

View Issue Detail

☐ Tested

Admin **Custodian** **Maintenance**

The detail page shows the full-size photo, a distinct remarks callout, that vehicle's issue-history pie chart, the linked ticket (if one was opened from it), a report timeline, and the vehicle's last known map location.

SCENARIO

Reviewing everything known about one reported issue in one place.

WORKFLOW

1. Open any issue report row.
2. Confirm the photo, remarks callout, issue-history chart, linked ticket (if any), timeline, and location map all render correctly.

Edit an Issue Report

☐ Tested

Admin **Custodian**

Correct a report's description, severity, or other details before it moves further along.

SCENARIO

The initial severity was logged too low (or too high).

WORKFLOW

1. Open an existing Pending report and edit its severity/description.
2. Save, then confirm the change reflects on both the list and detail view.

Delete an Issue Report

☐ Tested

Admin

Removes a mistaken or duplicate report entirely.

SCENARIO

The same issue was accidentally submitted twice.

WORKFLOW

1. Open Issue Reports, select the duplicate, delete it.
2. Confirm it no longer appears in the list.

Maintenance Tickets 0/14 tested

The core workflow: a ticket is a Main Issue container. During inspection it's populated with one or more independent Sub-Issues, each running Open → Under Repair → For Inspection → For Confirmation → Done (or Deferred). The ticket itself only closes once every sub-issue has ended one way or another.

Create a Ticket

☐ Tested

Admin

Opens a Main Issue on a vehicle and assigns it to a Custodian for physical inspection. Blocked on archived/decommissioned vehicles, and blocked if that same Main Issue is already open on that vehicle.

SCENARIO

A vehicle needs a formal maintenance ticket opened after an issue report or a routine finding.

WORKFLOW

1. Maintenance Tickets → Add. Pick vehicle, custodian, priority, and description.
2. Submit and confirm the ticket shows status Open.

3. Confirm the assigned custodian receives a notification.
4. Try creating a second ticket with the same title on the same vehicle — confirm it's blocked with a message pointing at the existing ticket.

Submit Inspection

☐ Tested

Custodian

Only the assigned custodian can inspect an Open ticket. "No Issues" effectively clears it; "Needs Maintenance" creates one sub-issue per real defect found and flips the vehicle to Under Maintenance.

SCENARIO

A custodian physically inspects the vehicle named on a newly assigned ticket.

WORKFLOW

1. Log in as the assigned custodian and open the ticket under Assigned Inspections.
2. Submit inspection with result "Needs Maintenance" and two sub-issues.
3. Confirm the ticket becomes Active and the vehicle's condition becomes Needs Repair.

Add a Sub-Issue Mid-Ticket

☐ Tested

Custodian

Maintenance

Appends a newly discovered defect while the ticket is Active. Only the assigned custodian, or a mechanic already working a sub-issue on this ticket, can do this — never Admin directly.

SCENARIO

Mid-repair, a mechanic finds a second, unrelated problem.

WORKFLOW

1. As the assigned custodian or an assigned mechanic, open the Active ticket.
2. Add a new sub-issue with a title and maintenance type.
3. Confirm it appears in the sub-issue list as Open.

Assign a Mechanic (Work Order)

☐ Tested

Admin

Dispatches one Open sub-issue to a Maintenance Personnel account along with a maintenance type. Only possible while the ticket is Active and that sub-issue is still Open.

SCENARIO

An inspection just logged a sub-issue that needs a mechanic dispatched.

WORKFLOW

1. Open an Active ticket, pick an Open sub-issue.
2. Assign a mechanic and a maintenance type.
3. Confirm it becomes Under Repair and the mechanic receives a notification.

Reassign a Mechanic

☐ Tested

Admin

Hands an in-progress (Under Repair) work order to a different mechanic, with a required reason — for when the original mechanic becomes unavailable.

SCENARIO

The assigned mechanic calls in sick mid-repair.

WORKFLOW

1. Open a sub-issue that is Under Repair.
2. Reassign it to a different mechanic with a reason.
3. Confirm both the new and previous mechanic receive notifications, and the sub-issue stays Under Repair.

Log Repairs

☐ Tested

Maintenance

Only the assigned mechanic can log what was actually done — logs, parts used, cost, dates, and an optional photo/receipt — which moves the sub-issue to For Inspection and notifies the custodian.

SCENARIO

A mechanic finishes physical work on an assigned sub-issue.

WORKFLOW

1. Log in as the assigned mechanic, open the work order under My Work Orders.
2. Fill in repair logs, parts used, cost, and dates; attach a photo if relevant.
3. Submit and confirm the status becomes For Inspection.

Verify Repair — Functional Test

☐ Tested

Custodian

An independent UAT gate: the custodian runs a functional checklist and must attest they personally operated and tested the vehicle. A failed checklist item blocks approval outright — a failed test can never be Approved.

SCENARIO

A mechanic logged a repair; it needs independent proof it actually works.

WORKFLOW

1. As the assigned custodian, open the sub-issue that's For Inspection.
2. Run the checklist with one item marked failed, try to Approve — confirm it's blocked.
3. Mark everything passed, check the attestation box, Approve.
4. Confirm the sub-issue moves to For Confirmation.

Reject a Repair

☐ Tested

Custodian

The same verification screen — choosing Rejected instead sends the sub-issue straight back to Under Repair for the mechanic to redo.

SCENARIO

The repair didn't actually fix the problem.

WORKFLOW

1. Verify a For Inspection sub-issue with verdict Rejected and notes explaining why.
2. Confirm it returns to Under Repair and the mechanic is notified.

Confirm a Sub-Issue

☐ Tested

Admin

The final Tier-2 sign-off. Confirmed marks the sub-issue Done and writes a permanent Maintenance Record with its cost/parts/dates; Reopened sends it back to Under Repair instead.

SCENARIO

A custodian has already approved the repair; Admin gives final sign-off.

WORKFLOW

1. Open a sub-issue that's For Confirmation.
2. Confirm it Done.
3. Check Maintenance Records for a new entry, and confirm the ticket's progress count increased.

Defer a Sub-Issue

☐ Tested

Admin

Records a decision not to fix an item right now (e.g. a backordered part), with a mandatory reason. It becomes a terminal Deferred state, and a breadcrumb Issue Report is opened or resurfaced so the defect is never silently forgotten.

SCENARIO

A needed part won't arrive for weeks, but the rest of the ticket shouldn't be held up.

WORKFLOW

1. On an Active ticket, defer an unfinished sub-issue with a reason.
2. Confirm it shows Deferred.
3. Check Issue Reports and confirm a matching breadcrumb report now exists (or was resurfaced).

Close a Ticket — Clean Close

☐ Tested

Admin

Available once every sub-issue is Done. Frees the vehicle back to Available/Good in one action.

SCENARIO

All repairs on a ticket are confirmed and the vehicle is ready to go back into service.

WORKFLOW

1. Confirm every sub-issue on a ticket is Done.
2. Close the ticket.
3. Confirm the ticket becomes Closed and the vehicle returns to Available.

Close a Ticket — Decision-Close

☐ Tested

Admin

Closing is still allowed with unfinished sub-issues, but requires a deferral reason (the leftovers auto-defer) and an explicit fit-for-service answer. Answering "not fit" keeps the vehicle under maintenance even after the ticket closes.

SCENARIO

A vehicle needs to be pulled from this ticket for budget or scheduling reasons, with real work still unfinished.

WORKFLOW

1. Close a ticket while a sub-issue is still Under Repair.
2. Provide a deferral reason and answer "not fit for service".
3. Confirm the ticket closes, the unfinished sub-issue shows Deferred, and the vehicle stays Under Maintenance rather than returning to Available.

Cancel / Uncancel a Ticket

☐ Tested

Admin

Cancel is available at any point before Closed, and resets any linked issue reports back to Pending. Uncancel restores the ticket to whichever phase it was in (Open or Active) if it turns out it's still needed.

SCENARIO

A ticket was opened by mistake, then turns out to be needed after all.

WORKFLOW

1. Cancel an Open ticket, confirm it shows Cancelled.
2. Confirm the vehicle frees up (if no other tickets are open on it).
3. Uncancel it, confirm it returns to its prior phase.

Delete a Ticket

☐ Tested

Admin

Fully discards a ticket. If it already had at least one Done sub-issue, it's archived as "Deleted" (recoverable) instead of vanishing outright. A Closed ticket can never be deleted.

SCENARIO

An Admin accidentally deletes a ticket that had real progress on it.

WORKFLOW

1. Delete a ticket that has no completed sub-issues — confirm it's simply gone.
2. Delete a different ticket that has at least one Done sub-issue — confirm it now appears in Ticket Archives tagged Deleted.
3. Try deleting a Closed ticket — confirm it's blocked.

Ticket Archives 0/3 tested

Browse Ticket Archives

☐ Tested

Admin

A permanent log of every Closed or Deleted ticket, searchable and filterable by vehicle.

SCENARIO

Looking up a vehicle's full maintenance-ticket history.

WORKFLOW

1. Open Ticket Archives.
2. Search by plate number, confirm matching archived tickets appear.

View a Closed Ticket

☐ Tested

Admin

A closed ticket is permanently read-only, but its full history should still be reviewable through a View button.

SCENARIO

Someone needs to double-check what was done on a ticket closed months ago.

WORKFLOW

1. Click View on a Closed archive row.
2. Confirm the full ticket (sub-issues, verdicts, notes) opens without offering any edit actions.

Reopen a Deleted Ticket

☐ Tested

Admin

Only archive entries tagged Deleted (never Closed) can be recovered — restores the ticket and every sub-issue exactly as it stood, blocked if a duplicate Main Issue already exists on that vehicle.

SCENARIO

A ticket deleted earlier turns out to still matter.

WORKFLOW

1. Find a Deleted archive entry and click Reopen.
2. Confirm a new ticket is created with the same sub-issues and progress restored.

Add a Vehicle

☐ Tested

Admin

Registers a new unit with a validated plate number. Starts life as Available / Good.

SCENARIO

A new ambulance joins the fleet.

WORKFLOW

1. Vehicle Management → Add.
2. Fill in the vehicle's details including plate number and type, submit.
3. Confirm it appears in the list as Available.

Edit a Vehicle

☐ Tested

Admin

Update a vehicle's details or photo without touching its live status.

SCENARIO

A vehicle's brand/model info was entered incorrectly.

WORKFLOW

1. Edit an existing vehicle's brand, model, or photo.
2. Save and confirm the changes stick on reload.

Archive a Vehicle

☐ Tested

Admin

Temporarily marks a unit Inactive — out of active lookups and dashboards — without losing its history.

SCENARIO

A vehicle is being pulled from service temporarily.

WORKFLOW

1. Archive a vehicle.
2. Confirm it disappears from active pickers (e.g. the vehicle dropdown on a new ticket) and shows Inactive.

Restore a Vehicle

☐ Tested

Admin

Reverses either an Archive or a Decommission, bringing the unit back to Available / Good.

SCENARIO

An archived vehicle is being put back into service.

WORKFLOW

1. Restore the vehicle archived above.
2. Confirm it's Available again and reappears in active pickers.

Decommission a Vehicle

☐ Tested

Admin

A permanent end-of-life write-off with a required reason. Blocked while any ticket on that vehicle is still open.

SCENARIO

A vehicle is beyond economical repair.

WORKFLOW

1. Try decommissioning a vehicle that still has an open ticket — confirm it's blocked.
2. Close or cancel that ticket, then decommission the vehicle with a reason.
3. Confirm its status becomes Decommissioned.

Readiness Check

☐ Tested

Admin

Custodian

A pass/fail checklist proving a vehicle will actually start and respond — not just that it has no open repair. Feeds the dashboard's "verified ready" vs. merely "available" distinction.

SCENARIO

Confirming an available vehicle is genuinely dispatch-ready.

WORKFLOW

1. Open a vehicle's profile and run a readiness check with one item marked failed.
2. Confirm its state shows "not ready".
3. Run it again with everything passed, confirm it shows "ready".

View Vehicle Reliability

☐ Tested

Admin

A per-vehicle reliability summary built from its maintenance history, for spotting repeat-failure patterns.

SCENARIO

Deciding whether a vehicle is becoming unreliable.

WORKFLOW

1. Open the profile of a vehicle with some prior maintenance history.
2. Confirm the reliability view accurately reflects that history.

Vehicle Types 0/1 tested

Add / Edit / Delete a Vehicle Type

☐ Tested

Admin

Manages the categories vehicles are grouped under (e.g. Ambulance, Fire Truck, Rescue Boat) — this grouping is what drives the dashboard's readiness/coverage panel.

SCENARIO

The barangay adds a new class of vehicle to the fleet.

WORKFLOW

1. Add a new vehicle type.
2. Assign a vehicle to it, confirm it appears as its own group on the dashboard's readiness panel.
3. Edit, then delete a test type you created.

Vehicle Location 0/2 tested

Manage Hubs & the Vehicles Map

☐ Tested

Admin

Hubs are named service locations pinned on a map within the barangay boundary. The map view shows a live vehicle count on each hub's marker.

SCENARIO

A new sub-station hub needs to be added and vehicles assigned to it.

WORKFLOW

1. Click "Add Hub", then click the map to pin a new location.
2. Confirm the new hub pin appears.
3. Set a vehicle's current location to that hub, confirm its pin's count increments.

Vehicle Location Record

☐ Tested

Admin

A searchable table view of the same location data — which vehicle is where — for a quick non-map lookup.

SCENARIO

Finding every vehicle currently parked at a specific hub.

WORKFLOW

1. Open the "Vehicle Location Record" tab.
2. Search by location name, confirm the matching vehicles list correctly.

Vehicle History 0/1 tested

View Vehicle History

☐ Tested

Admin

A chronological, read-only ledger of every notable event for every vehicle — added, updated, archived, readiness checks, schedule completions, and more.

SCENARIO

Auditing everything that's happened to one vehicle over time.

WORKFLOW

1. Edit a vehicle, then run a readiness check on it.
2. Open Vehicle History and filter to that vehicle.
3. Confirm both events appear, in the correct order.

Condition Monitoring 0/1 tested

Log / Edit / Delete a Condition Check

☐ Tested

Admin

Custodian

A periodic physical-condition assessment per vehicle (Good / Needs Inspection / Needs Repair / Damaged), independent from the ticket workflow.

SCENARIO

A routine walk-around inspection outside of any specific reported issue.

WORKFLOW

1. Add a condition check for a vehicle, marking it Needs Inspection.
2. Confirm it appears in the module list and on that vehicle's profile.
3. Edit, then delete a test entry.

Maintenance Schedule 0/4 tested

Preventive maintenance planned ahead of time, separate from reactive ticket repairs.

Create a Maintenance Schedule

☐ Tested

Admin

Maintenance

Books a future preventive-maintenance date for a vehicle, with a service location (dropdown of hubs, or "Other" free text) and optional assigned personnel. Blocked if that vehicle already has a Scheduled entry the same day. Can optionally recur every N months.

SCENARIO

Booking a routine oil change three weeks out, recurring every 6 months.

WORKFLOW

1. Maintenance Schedule → Add. Confirm the date field defaults to tomorrow.
2. Pick a hub from the Service Location dropdown (or choose "Other" and type a location).
3. Set a recurrence interval, submit, confirm it shows Scheduled.
4. Try adding a second schedule for the same vehicle on the same date — confirm it's blocked.

Edit a Maintenance Schedule

☐ Tested

Admin

Maintenance

Update date, location, or notes. The Status field on this form only ever offers Scheduled or Cancelled — "Completed" is deliberately unreachable here, to force going through the proper Mark Done flow instead.

SCENARIO

A booked service date needs to move.

WORKFLOW

1. Edit an existing schedule's date or location, save.
2. Confirm the change sticks.
3. Confirm the Status dropdown never offers "Completed" as an option.

Mark a Schedule Done

☐ Tested

Admin Maintenance

One action that completes the schedule, writes a proof-of-work Maintenance Record, and — if the schedule recurs — automatically books the next occurrence at the configured interval.

SCENARIO

A recurring oil change was just performed on schedule.

WORKFLOW

1. Open a recurring Scheduled entry, click Mark Done.
2. Fill in cost/notes and confirm.
3. Confirm a new Maintenance Record was created, the schedule shows Completed, and a new Scheduled entry now exists at the correct future date.

Cancel a Maintenance Schedule

☐ Tested

Admin Maintenance

Deleting a schedule cancels it rather than erasing it outright, keeping a record that it was once planned.

SCENARIO

A planned service is no longer needed.

WORKFLOW

1. Delete a Scheduled entry.
2. Confirm it now shows Cancelled rather than disappearing from the list.

Maintenance Records 0/3 tested

The unified ledger of completed and in-progress repair work, whether it originated from a ticket, a schedule, or a standalone entry.

Add a Maintenance Record

☐ Tested

Admin

Maintenance

Logs standalone repair work directly, outside the ticket flow. A pure mechanic account always logs it under their own name; Admin can assign it to someone else.

SCENARIO

A quick repair happens outside the formal ticket process.

WORKFLOW

1. As Maintenance Personnel, add a record for a vehicle.
2. Confirm it's attributed to your own account and the vehicle flips to Under Maintenance / Needs Repair.

Verify a Maintenance Record

☐ Tested

Custodian

The same Tier-1 verification concept as tickets — the Custodian marks a For Verification record Passed or Failed. Failed bounces it back to Under Repair.

SCENARIO

A standalone repair needs independent sign-off before it's considered done.

WORKFLOW

1. Verify a For Verification record as Failed, confirm it returns to Under Repair.
2. Repeat with Passed, confirm it stays For Verification awaiting Admin confirmation.

Confirm a Maintenance Record

☐ Tested

Admin

Final sign-off after a Passed verification. Confirmed marks it Completed and returns the vehicle to Available / Good; declining sends it back to Under Repair.

SCENARIO

A Custodian has already passed the repair; Admin gives final confirmation.

WORKFLOW

1. Confirm a Passed record.
2. Confirm its status becomes Completed and the vehicle is Available again.

Add a User

☐ Tested

Admin

Creates an account with one or more roles — a person can hold both Custodian and Maintenance Personnel at once, for example.

SCENARIO

A staff member does both vehicle inspections and physical repairs.

WORKFLOW

1. Create a user assigned both Custodian and Maintenance Personnel roles.
2. Log in as them, confirm the sidebar shows the union of both portals' modules.

Edit a User

☐ Tested

Admin

Update an existing account's name, email, or role assignments.

SCENARIO

An employee changes position and needs a different role.

WORKFLOW

1. Edit a user's roles, save.
2. Confirm their next login reflects the new module set.

Deactivate a User

☐ Tested

Admin

Immediately revokes every active session token for that account, not just a flag — they're logged out everywhere right away. An Admin cannot deactivate their own account.

SCENARIO

An employee leaves and their access must be cut off immediately, even mid-session.

WORKFLOW

1. Log in as a user in one browser session.
2. From another session, deactivate that user.
3. Confirm the first session is rejected on its very next request.

4. Try deactivating your own logged-in Admin account, confirm it's blocked.

Activate a User

☐ Tested

Admin

Reverses a deactivation so the account can log in again.

SCENARIO

A previously deactivated employee returns.

WORKFLOW

1. Reactivate a deactivated user.
2. Confirm they can log in normally again.

Reports 0/1 tested

Generate a Report

☐ Tested

Admin

On-demand report types built from the fleet's live data (e.g. maintenance cost, fleet status) for a chosen range or filter.

SCENARIO

Preparing a summary for a barangay council meeting.

WORKFLOW

1. Open Reports and generate each available report type.
2. Confirm the output matches what's actually in the system for that range.

Logs 0/1 tested

View Activity Logs

☐ Tested

Admin

A chronological audit trail of every meaningful action taken across the system — who did what, on which record, and when. Distinct from Vehicle History, which is scoped to a single vehicle.

SCENARIO

Investigating who made a particular change.

WORKFLOW

1. Perform a handful of actions across different modules.
2. Open Logs, confirm each appears with the correct actor, action, and timestamp.

Notifications 0/1 tested

Receive & Manage Notifications

☐ Tested

Admin

Custodian

Maintenance

In-app alerts for anything relevant to your role (new inspection assignment, work order dispatched, verification needed, ticket closed, etc.) — mark individually read, mark all read, or delete.

SCENARIO

A mechanic needs to know the moment a work order is dispatched to them.

WORKFLOW

1. Trigger an action that notifies another role (e.g. assign a mechanic to a sub-issue).
2. Log in as that user, confirm the notification appears.
3. Mark it read, then use "mark all as read", then delete a notification.

Dev Tools 0/1 tested

Impersonate a User

☐ Tested

Admin

A local/testing-only shortcut for fast role-switching without needing separate credentials for every test account. It doesn't exist in production.

SCENARIO

Quickly checking how a screen looks under a different role while testing.

WORKFLOW

1. Click Impersonate and pick a target account.
2. Confirm the UI switches to that account's portal and permissions.
3. Switch back to the real Admin account when done.

Dark / Light Theme Toggle

☐ Tested

Admin

Custodian

Maintenance

The whole app, including the public Login/About/Developers pages, supports both a dark and light visual theme.

SCENARIO

A user prefers a light interface during the day and dark at night.

WORKFLOW

1. Toggle the theme switch.
2. Browse a few different modules plus the public About/Developers pages.
3. Confirm text, icons, and status pills stay legible in both themes.

Browse Public Pages

☐ Tested

Admin

Custodian

Maintenance

Login, About Us, and Developers pages are reachable without a session, sharing a common header and footer distinct from the authenticated app.

SCENARIO

A visitor wants to learn about the system before logging in.

WORKFLOW

1. Log out, visit the Login page directly.
2. Navigate to About Us, then Developers, using the header nav.
3. Confirm each page renders correctly and the links between them work.
