

User Manual

How to operate the VMS — every workflow explained with a real scenario, its data flow, and the exact steps to perform it. Organized by the task you want to accomplish.

Audience: Admin · Custodian · Maintenance Personnel **Platform:** Web (desktop) **Version:** 2.0

● Admin

Manages vehicles, users, categories, and locations. Creates and confirms maintenance tickets, assigns mechanics, and sees all reports, logs, and dashboards.

● Custodian

Inspects vehicles, reports issues (with photos), runs condition checks, and verifies that completed repairs are genuinely fixed.

● Maintenance Personnel

Receives work orders, performs and logs repairs (parts, cost, dates), and records maintenance activities and schedules.

| 4. Reporting a vehicle issue | 9. Availability Forecast |
| 5. Condition monitoring | 10. Reports, logs & users |

01 Signing in

— SCENARIO

A barangay staff member opens the system at the start of their shift. What they can do depends on their role.

— STEPS

- 1 Open the VMS web address in a desktop browser.
- 2 Enter your **email** and **password**, then click **Sign in**.
- 3 You land on your **Dashboard**. The left menu shows only the features your role is allowed to use.

Accounts are created by an Admin (see [Reports, logs & users](#)). If you can't sign in, ask your Admin to check or reset your account.

02 Adding a vehicle ADMIN

— SCENARIO

The barangay acquires a new ambulance. The Admin registers it so it appears in the fleet and can be monitored.

— DATA FLOW

[Admin] → fill 3-step form → [System] → vehicle saved as **Available / Good**

— STEPS

- 1 Go to Vehicle Management and click **Add Vehicle**.
- 2 **Step 1 — Basic Info:** enter Vehicle Name, Plate Number, and Vehicle Type, then click **Next**.
- 3 **Step 2 — Specs:** enter Brand, Model, Year, Capacity (with unit), Color, and Fuel Type, then click **Next**.
- 4 **Step 3 — Photo & Location:** upload a photo, choose the current location, add remarks, then click **Add Vehicle**.

You can jump back to a completed step by clicking its green tab at the top. Photos are stored securely in cloud storage.

03 Editing / archiving a vehicle ADMIN

— SCENARIO

An old vehicle is retired from service, or a vehicle's details need correcting.

— DATA FLOW

[Admin] —▶ Archive —▶ vehicle → Inactive (off available list) —▶ Restore —▶ vehicle

— STEPS

- 1 Go to [Vehicle Management](#) and click the vehicle.
- 2 To edit: open the **Edit** tab, change fields, and click **Save Changes**.
- 3 To retire: use **Archive** — the vehicle becomes **Inactive** and stops counting as available, but its full history is kept.
- 4 To bring it back: click **Restore** on the archived vehicle.

04 Reporting a vehicle issue

CUSTODIAN

ADMIN

— SCENARIO

A custodian notices the ambulance's brakes feel weak. They file a report with a photo so it can be tracked and fixed.

— DATA FLOW

[Custodian] → submit issue + photo → vehicle → Needs Inspection → [Admin] →

— STEPS

- 1 Go to [Report Vehicle Issue](#) (Custodian) or [Issue Reports](#) (Admin).
- 2 Click **Report Vehicle Issue / Add**.
- 3 Select the vehicle, choose the **Issue Type** and **Severity**, and describe the problem.
- 4 Click **Choose File** to attach a photo as evidence.
- 5 Click **Submit**. The report starts as **Pending**; you can track it under your reports.

A custodian may edit or delete their own report only while it is still **Pending**. Once the Admin acts on it, it is locked.

05 Condition monitoring

CUSTODIAN

ADMIN

— SCENARIO

During a routine check, a custodian records the physical condition of each vehicle so problems are caught early.

— DATA FLOW

[Custodian] → log condition → if Needs Repair / Damaged → vehicle Under Maintenance

— STEPS

- 1 Go to [Condition Monitoring](#) and click **Add**.
- 2 Select the vehicle and choose the **Condition Result** (Good, Needs Inspection, Needs Repair, or Damaged).
- 3 Add observations and remarks, then click **Save**.

A result of **Needs Repair** or **Damaged** automatically moves the vehicle to **Under Maintenance**, taking it off the available list.

06 Maintenance ticket — the 5-phase workflow

ADMIN

CUSTODIAN

MAINTENANCE

— SCENARIO

The reported brake issue is real. The Admin opens a ticket, a custodian inspects, a mechanic repairs, the custodian verifies, and the Admin closes it — a full, accountable repair cycle.

— DATA FLOW

[Admin] create → [Custodian] inspect → [Admin] assign mechanic → [MP] rep

PHASE 1 ADMIN Create & assign

Go to [Maintenance Tickets](#) → **Create Ticket** (or open an issue and click **Create Ticket** to link it). Enter title, description, priority, and assign a **Custodian**. Status → **Open**.

PHASE 2 CUSTODIAN Inspect

Open the ticket under [Assigned Inspections](#) → **Inspect**. Choose **Needs Maintenance** (→ For Maintenance) or **No Issues** (→ skips to confirmation). Add notes and submit.

PHASE 3a ADMIN Assign mechanic

Open the ticket (status **For Maintenance**) → **Assign Mechanic**. Pick the Maintenance Personnel, the maintenance type, and add work-order notes. Status → **Under Repair**; vehicle → **Under Maintenance**.

PHASE 3b MAINTENANCE Log repairs

Open the ticket under [My Work Orders](#) → **Log Repairs**. Enter what was done, parts used, cost, dates, and the **Estimated Return Date** (feeds the Availability Forecast). Status → **For Inspection**.

PHASE 4a CUSTODIAN Verify

Open the ticket under [Repair Verifications](#) → **Verify**. **Approved** → For Confirmation. **Rejected** → back to Under Repair for rework.

PHASE 4b ADMIN Confirm

Open the ticket (status **For Confirmation**) → **Confirm**. **Confirmed** → status **Done**; vehicle returns to **Available**, the linked issue is resolved, and the ticket is archived. **Reopened** → sends it back for more work.

At any active stage the Admin can **Cancel** a ticket (and **Un-cancel** to restore it to the exact stage it left). Completed tickets are kept in [Ticket Archives](#) and can be reopened if needed.

07 Maintenance records (direct logging)

MAINTENANCE

ADMIN

— SCENARIO

A minor service was done directly (or by an outside shop) without a full ticket. The mechanic logs it so the vehicle's maintenance history stays complete.

— DATA FLOW

[MP] add record → Under Repair → mark done → For Verification → [Custodian]

— STEPS

- 1 Go to [Maintenance Records](#) and click **Add**.
- 2 Select the vehicle, maintenance type, and describe the problem and actions taken; add parts used and progress status.
- 3 Click **Save**. The vehicle moves to **Under Maintenance**.
- 4 When the mechanic marks it **Completed**, it becomes **For Verification** — a mechanic cannot close their own work.
- 5 A **Custodian** verifies (Passed / Failed), then an **Admin** confirms to mark it **Completed** and return the vehicle to service.

Every ticket confirmed **Done** is also written here automatically, so [Maintenance Records](#) is the single, complete maintenance history.

08 Maintenance schedules

ADMIN

MAINTENANCE

— SCENARIO

To prevent breakdowns, the Admin plans a routine oil change for next month so it isn't forgotten.

— DATA FLOW

[Admin / MP] book a date → Scheduled → shows on Dashboard as Upcoming / Overdue

— STEPS

- 1 Go to [Maintenance Schedule](#) and click **Add**.
- 2 Select the vehicle, maintenance type, date, time, and service location; optionally assign personnel and add notes.
- 3 Click **Save**. It appears as **Scheduled**.
- 4 Watch the Dashboard: due-soon items show under **Upcoming Maintenance**; past-due items show under **Overdue Maintenance**.

09 Availability Forecast NEW MAINTENANCE ADMIN

— SCENARIO

The Admin is planning next week's coverage and needs to know not just what's available now, but **when** the vehicles under repair will be back.

— DATA FLOW

[MP / Admin] set estimated return date → [System] → [Admin] reads forecast (re

— STEPS — SETTING THE ESTIMATE

- 1 **As Maintenance Personnel:** when logging repairs on a work order, fill in the **Estimated Return Date** field.
- 2 **As Admin:** open the vehicle in Vehicle Management → **Edit** tab → set **Estimated Return Date** → **Save Changes**.

— STEPS — READING THE FORECAST

- 1 Open the Dashboard.
- 2 Find the **Availability Forecast** panel. The tag shows how many vehicles are **ready now**.
- 3 Each vehicle under maintenance is listed with **Ready by <date>**, or **"No estimate yet"** if none is set.
- 4 Any **overdue scheduled maintenance** is highlighted below the list.

The estimate clears automatically when the vehicle returns to service, so the forecast always reflects only vehicles that are genuinely still out.

10 Reports, logs & users ADMIN

— SCENARIO

The Admin prepares a monthly summary for the barangay council and needs accountability records.

— STEPS

- 1 Reports:** go to [Reports](#) to generate summaries for vehicles, issues, maintenance, and history.
- 2 Logs:** go to [Logs](#) to review who did what, in which module, and when.
- 3 Vehicle History:** go to [Vehicle History](#) to see every activity tied to a specific vehicle.
- 4 Users:** go to [Users](#) → **Add User** to create an account and assign a role (Admin, Custodian, or Maintenance Personnel). Existing users can be activated or deactivated.
- 5 Types & Locations:** use [Vehicle Types](#) and [Vehicle Location](#) to keep classifications and stationing up to date.
